Outline

Mental Models

• Human-aware agent

Interpretable Behaviour

- Explicability
- Legibility
- Predictability

Explanations

• Model reconciliation

Motivation

- Collaborations between people and AI systems
 - I.e., systems with humans in the loop
 - Augment perception, cognition, problem-solving abilities of people
 - Examples
 - Help physicians make more timely and accurate diagnoses
 - Assistance provided to drivers of cars to help them avoid dangerous situations and crashes
- Objective: Systems that can interact intuitively with users and enable seamless machine-human collaborations
 - Explainable behaviour
 - Explainable AI = XAI

Proposed Solution

- Goal: Synthesise explainable behaviour
- Take into account the mental model of the human in the loop
 - Mental model:
 - Goals + capabilities of the humans in the loop
 - Human's model of AI agent's goals + capabilities

Classical Intelligent Agent

http://bit.ly/3bno2io

Classical Planning

- Given (Σ, s_0, S_g) , i.e., the agent's model \mathcal{M}^R
- Find a plan $\pi = \langle a_1, a_2, ..., a_n \rangle$ that transforms s_0 to a state $s_n \in S_g$

Collaborative Planning

- Given (Σ, s_0, S_g) , i.e., the agent's model \mathcal{M}^R
- Find a joint plan $\pi = \langle a_1^R, a_2^H, ..., a_n^? \rangle$ that transforms s_0 to a state $s_n^+ \in S_g$

Human-aware Planning

- Next to \mathcal{M}^R
- Agent's model \mathcal{M}_r^H of the human's model \mathcal{M}^H
 - Allows the agent to **anticipate** human behaviour to
 - assist
 - avoid
 - team

Human-aware Planning

- Next to \mathcal{M}^R and \mathcal{M}^H_r
- Agent's model $\widetilde{\mathcal{M}}_h^R$ that the agent expects the human to have of \mathcal{M}^R
 - Allows the agent to **anticipate** human expectations to
 - conform to those expectations
 - explain its own behaviour in terms of those expectations

Human-aware Intelligent Agent

http://bit.ly/3bno2io

Generating Mental Models

- Known beforehand (handcrafted/researched)
 - Urban Search and Rescue
 - Teaching
- Learning simple models for generating explanations/explicability
- Learning full models (transition functions, rewards)
 - Through interaction with users

XAI & Explanations

- Standard XAI: view of explanations too simple
 - Debugging tool for "inscrutable" representations
 - "Pointing" explanations (primitive)

Prediction:Difference between leftPrediction:School busand right magnified by 10Ostrich

- Explaining decisions will involve pointing over space-time tubes
- Explanations critical for collaboration
 - But not as a monologue from the agent \rightarrow interaction

Please point to the "ostrich" part

Ethical Quandaries of Interaction

- Evolutionary, mental modelling allowed us to both cooperate or compete/sabotage each other
 - Lying is only possible because we can model others' mental states
- Human-aware AI systems with mental modelling capabilities bring additional ethical quandaries
 - E.g., automated negotiating agents that misrepresent their intentions to gain material advantage
 - Your personal assistant that tells you white lies to get you to eat healthy (or not...)

Every tool is a weapon, if you hold it right. --Ani Difranco

Ethical Quandaries of Interaction

- Humans' example closure tendencies are more pronounced for emotional/social intelligence aspects
 - No on who saw Shakey the first time thought it could shoot hoops, yet the first people interacting with Eliza assumed it was a real doctor
 - Concerns about human-aware AI "toys" such as Cozmo (e.g., Sherry Turkle)

is a more suggrading syncholispice. e original program was described by Joseph Weizenbaum in 1966. is implementation by Norbert Landsteiner 2005.

ZA: Is something troubling you ? Men are all alike. ZA: What is the connection, do you suppose ? They're always bugging us about something or other. ZA: Can you think of a specific example ? Note: Well, my boyfriend made me come here. ZA: Is it important to you that your boyfriend made you come here I he says I'm depressed much of the time. ZA: I am sorry to hear that you are depressed. I t's true. I am unhappy. Zh: Can you explain what made you unhappy ?

Differences in Mental Models

- Expectations on capabilities
 - Human may have misconceptions about robot's actions
 - Certain actions in human's mental model may not be feasible for robot
- Expected state of the world
 - Human may assume certain facts are true (when they are not true)
- Expected goals
 - Human may have misconceptions about robot's objectives/intentions
- Sensor model differences
 - Human may have partial observability of robot's activities
 - Human may have incorrect beliefs about robot's observational capabilities
- Different representations
 - Robot's innate representation scheme might be too complex for human
 - Human may be thinking in terms of a different vocabulary

Urban Search and Rescue (USAR)

- Robot deployed to a disaster area
- Tasks robot can perform tasks:
 - Survey particular rooms
 - Identify survivors
 - Perform triage

- Two agents in domain
 - Internal agent Robot
 - External agent Human
- Their models may diverge leading to different expectation on behaviours

Human's mental model of the Robot Model

Robot's model

Model Differences

- Robot and human may have different models of same task
 - Divergence in models can lead to expectation mismatch
 - Consequence: Plans that are optimal to robot may not be so in model of human
 - Inexplicable plans
- Robot has two options
 - Explicable planning sacrifice optimality in own model to be explicable to human
 → interpretable behaviour
 - Plan Explanations resolve perceived suboptimality by revealing relevant model differences
 - \rightarrow model reconciliation

Intermediate Summary

- Different mental models
 - Mental model of the human
 - Mental model that the human has of the agent
 - Mental model that the agent assumes the human has of the agent
- Differences between mental models
 - May lead to inexplicable behaviour
- Ethical quandaries
 - Modelling mental state of humans requires ethical behaviour of agent

Outline

- Mental Models
 - Human-aware agent
- Interpretable Behaviour
 - Explicability
 - Legibility
 - Predictability
- Explanations
 - Model reconciliation

Interpretable Behaviour

- Explicable behaviour
 - Acting in a way that make sense to the user
- Legible behaviour
 - Acting in a way that convey necessary information to the user
- Predictable behaviour
 - Acting in a way that allow users to accurately anticipate future behaviour

Why *Explicable* Behaviour?

- Robot's behaviour may diverge from human's expectations of it
- Human may get surprised by robot's inexplicable behaviour
- One way to avoid surprising a human involves generating explicable behaviour by conforming to human's expectations
 - Account for human's mental model

Explicable Behaviour

 Example: Robot may have to sacrifice its optimality to improve explicability

Human's mental model of the Robot Model

Robot's model

Model-based Explicable Behaviour

- Human's mental model is available to the robot
- But robot may not be able to plan directly with human mental model
- Find a valid plan that is "closest" to the expected plan
- Involves minimising distance w.r.t. expected plans
 - Cost difference in human model
 - Action set difference

Kulkarni A, Zha Y, Chakraborti T, Vadlamudi SG, Zhang Y, Kambhampati S. Explicable planning as minimizing distance from expected behavior. In Proceedings of AAMAS 2019 as extended abstract

Model-free Explicable Planning

• Problem to solve:

- Robot may not have human's mental model \mathcal{M}_h^R upfront
 - But: We do not necessarily need to learn the full model

Zhang Y, Sreedharan S, Kulkarni A, Chakraborti T, Zhuo HH, Kambhampati S. Plan explicability and predictability for robot task planning. In Proceedings of ICRA 2017

Model-free Explicable Planning

- Understand = Associate abstract tasks with actions
- Consider as a labelling process

Why *Legible* Behaviour?

- In human-robot teams, essential for the robot to communicate its intentions and objectives to the human
 - Explicitly communicate its intentions to the human
 - Generating a behaviour which implicitly reveals robot's intentions to the human
 - Might be easier for the human teammate

Legible Behaviour

- In general, involves a setting where
 - Human has access to candidate goals but does not know true goal
- Robot's objective: Convey true goal implicitly through its behaviour
- Human updates its belief on set of candidate goals when it receives observations
- By synthesising legible behaviour, robot reduces human's uncertainty over candidate goals

Online Legible Behaviour

- Enables human to quickly and confidently infer robot's true goal
- Human's belief update is captured using a probabilistic goal recognition system
- Actions that maximise the posterior probability of the true goal *G* are favoured

 $\underset{G \in \mathcal{G}}{\operatorname{argmax}} P(G|Observations)$

Quiz

• What is the most legible robot motion to pick-up item 2?

Legible Robot Motion

- Example: Which med kit will the robot pick up?
- While performing goal recognition, human considers shortest distances
- Approach involves finding a trajectory endpoint between start point and true goal such that posterior probability of true goal is maximised
 - The sooner the goal is recognised in the trajectory, the better is the trajectory's legibility

Dragan AD, Lee KC, Srinivasa SS. Legibility and predictability of robot motion. In Proceedings of HRI 2013.

Transparent Planning

- Example: Is the robot surveying the rooms or performing triage?
- Whenever an action is performed, goal recognition system is used to update human's belief
- Objective: Reach a target belief where true goal is more probable than other goals
- Take the first applicable action associated with a belief of highest utility (closest to target belief)

Offline Goal Legibility

- Generalises problem of goal legibility in terms of
 - Partial observability of the human
 - Amount of goal legibility achieved
- Partial observability:
 - Multiple action and state pairs may yield the same observation
 - Human's belief update consists of all possible states that emit given observation and are valid considering previous belief
 - $b_{i+1} = update(b_i, o_{i+1})$

Offline Goal Legibility

- Example: Robot has to survey and treat a victim
 - Has to convey which victim it is treating
- Key idea: Limit number of candidate goals (at most *j* goals) possible in observer's final belief
- Explores legible behaviour that satisfies predetermined amount of goal legibility, i.e., the plan is *j*-legible

Kulkarni A, Srivastava S, Kambhampati S. A unified framework for planning in

adversarial and cooperative environments. In Proceedings of the AAAI 2019.

Why **Predictable** Behaviour?

In human-robot teams, if robot's behaviour cannot be anticipated by human, it can hamper team performance Predictable robot behaviours are easy for the human to understand and help in engendering trust in the robot

Predictability and legibility are fundamentally different and often contradictory properties of motion

Predictable Behaviour

- In general, involves a setting where
 - Human knows start state and goal but does not know which plan will be executed
- Robot's objective is to behave in a way that can be anticipated by the human
- Observer updates its belief on set of valid plans when it receives observations
- By synthesising predictable behaviour, robot reduces human's uncertainty over possible behaviours

Predictable Robot Motion

- Example: What trajectory will robot take?
- Human assumes that robot is rational and that it prefers short length trajectory
- Most predictable trajectory optimises path towards the goal (*C* cost fct. modelling human's expectation) argmin C(traj) traj
- There are two aspects of generating predictable motion:
 - Learning *C*
 - Minimising *C*

Dragan AD, Lee KC, Srinivasa SS. Legibility and predictability of robot motion. In Proceedings of HRI 2013.

t-Predictability

ığı

?

?

ığı

1

1

- Example: What route would the robot take to survey the rooms?
- *t*-predictability score P_t = probability of sequence $a_{t+1} \dots a_T$, given start state, goal and $a_1 \dots a_t$
 - *t*-predictable planner finds action sequence *a*^{*} such that

$$\boldsymbol{a}^* = \operatorname*{argmax}_{\boldsymbol{a} \in A} P_t(\boldsymbol{a})$$

Fisac JF, Liu C, Hamrick JB, Sastry SS, Hedrick JK, Griffiths TL, Dragan AD. Generating plans that predict themselves. In Proceedings of WAFR 2016.

Offline Plan Predictability

- Assume offline setting
 - Human has partial observability
 - Belief update performed after receiving all observations
- Human guesses robot's actions based on plans that
 - Are consistent with observation sequence
 - Achieve goal
- Generalises the problem of conveying actions to observer

Offline Plan Predictability

- Example:
 - Robot has to perform triage
 - Which med kit should the robot pick?
- Solution: Generate a plan whose observation sequence is associated with
 - At least *m* plans to the same goal,
 - And the plans have high similarity.
 - i.e., *m* plans that are at most *d* distance from each other *m*-similar plans
- Using plan distance metrics
 - Action set distance gives the number of similar actions given two plans

Summary

- Aspects of interpretable behaviour
- Explicability
 - Act in a way that is comprehensible to the human agent
- Legibility
 - Act in a way such that a human agent can determine which goal is pursued by agent
- Predictability
 - Act in a way such that a human agent can predict the next steps given the previous steps

Outline

- Mental Models
 - Human-aware agent
- Interpretable Behaviour
 - Explicability
 - Legibility
 - Predictability
- Explanations
 - Model reconciliation

Plan Explanations

- Conforming to expectations of human
 - E.g., by explicable planning; may involve giving up optimal plan
 - But: May not be feasible
- Model reconciliation:
 Bring mental model closer by explanations
- Planner is optimal in own but not in human's model
- Given a plan, explanation is a model update
- After explanation, plan is also optimal in the updated human model

Example

 Mock search and reconnaissance scenario with internal robot and external human

Aspects to Explanations

- Completeness: No better explanation exists, no aspect of plan remains inexplicable
 - Requires explanations of a plan to be comparable
- Conciseness: Explanations are easily understandable to the explainee
 - The larger an explanation, the harder for the human to incorporate information into deliberation process
- Monotonicity: Remaining model differences cannot change completeness of explanation, i.e., all aspects of model that yielded plan are reconciled
 - Subsumes completeness
- Computability: Ease of computing explanation from robot's point of view

Types of Explanations

- Plan Patch Explanation (PPE)
 - Provide model differences pertaining to only the actions present in the plan that needs to be explained
- Model Patch Explanation (MPE)
 - Provide all model differences to the human
- Minimally Complete Explanation (MCE)
 - Shortest complete explanation
 - Can be rendered invalid given further updates
- Minimally Monotonic Explanation (MME)
 - Shortest explanation preserving monotonicity
 - Not necessarily unique as there may be model differences supporting the same causal links in the plan; exposing one link is enough (to guarantee optimality in the updated model)

Aspects of Types of Explanations

- Plan Patch Explanation (PPE)
- Model Patch Explanation (MPE)
- Minimally Complete Explanation (MCE)
- Minimally Monotonic Explanation (MME)

Explanation Type	Completeness	Conciseness	Monotonicity	Computability
PPE	×	√*	×	\checkmark
MPE	\checkmark	×	\checkmark	\checkmark
MCE	\checkmark	\checkmark	×	?
MME	\checkmark	\checkmark	\checkmark	?

 $|approx. MCE| \leq |exact MCE| < |MME| \ll |MPE|$

* In the sense that it focuses on the differences w.r.t. the plan but not necessarily a short explanation

Example – FetchWorld

 Fetch robot whose design requires it to tuck its arms and lower its torso or crouch before moving – not obvious to human navigating

Robot's Model

(:action move (:action move (?from ?to - location) (?from ?to - location) :parameters :parameters :precondition (and (robot-at ?from) :precondition (and (robot-at ?from)) (hand-tucked) (crouched)) :effect (and (robot-at ?to) :effect (and (robot-at ?to) (not (robot-at ?from)))) (not (robot-at ?from)))) (:action tuck (:action tuck :parameters :parameters () () :precondition () :precondition () :effect (and (hand-tucked) :effect (and (hand-tucked))) (crouched))) (:action crouch (:action crouch :parameters () :parameters () :precondition () :precondition () (and (crouched))) :effect :effect (and (crouched)))

Chakraborti T, Sreedharan S, Zhang Y, Kambhampati S. Plan explanations as model reconciliation: Moving beyond explanation as soliloquy. IJCAI 2017.

Human's Model

Example – FetchWorld

- Initial state and goal:
- Robot's optimal plan:
- Human's expected plan:

(:init (block-at b1 loc1) (robot-at loc1) (hand-empty))
(:goal (and (block-at b1 loc2)))

pick-up b1 -> tuck -> move loc1 loc2 -> put-down b1

pick-up b1 -> move loc1 loc2 -> put-down b1

Human's Model

Robot's Model

(:action move :parameters :precondition	(?from ?to - location) (and (robot-at ?from) (hand-tucked) (crouched))	(:action move :parameters :precondition	(?from ?to - location) (and (robot-at ?from))
:effect	<pre>(and (robot-at ?to) (not (robot-at ?from))))</pre>	:effect	(and (robot-at ?to) (not (robot-at ?from))))
(:action tuck :parameters :precondition :effect	() () (and (hand-tucked) (crouched)))	(:action tuck :parameters :precondition :effect	() () (and (hand-tucked)))
(:action crouch :parameters :precondition :effect	() () (and (crouched)))	(:action crouch :parameters :precondition :effect	() () (and (crouched)))

Example – FetchWorld

pick-up b1 -> tuck -> move loc1 loc2 -> put-down b1

- :precondition ()
- :effect (and (crouched)))
